Info'structure in electricity applications

- information infrastructure**
 - HW, SW, comm, applications,
 - no significant changes in 40 years
 - more performant communication
 - still centralised, human in the loop
- current trends**
 - off-the-shelf components
 - heterogeneous
 - more decentralised intelligence
 - data vs. information vs. knowledge

© K.U.Leuven - ESAT/ELECTA | Geert.Deconinck@esat.kuleuven.be | 8

lecta **Embedded automation**
KU LEUVEN

- opportunities for autonomous, decentralised
 - more flexibility
- vulnerabilities
 - fault propagation
 - interdependencies

© K.U.Leuven - ESAT/ELECTA Geert.Deconinck@esat.kuleuven.be 9

lecta **Requires methodology & architecture**
KU LEUVEN

- methodology
 - risk analysis
 - dependability specification
 - modelling & simulation
- architecture at middleware level
 - between OS and application
 - on heterogeneous platform
 - distributed, decentralised
 - for *dependable control* of power grid
 - survivability, self-healing, fault-tolerance, ...
 - redundancy & diversity

© K.U.Leuven - ESAT/ELECTA Geert.Deconinck@esat.kuleuven.be 10

lecta **Research questions...**
KU LEUVEN

- communication architecture
 - point-to-point, multicasting, broadcasting
 - time-triggered, event-triggered
 - push, pull
- interoperability
 - communication protocols
 - IEC61850, TASE.2 (ICCP), DNP3, IEC 60870, OPC...
 - vendor-independence, open, ...

© K.U.Leuven - ESAT/ELECTA Geert.Deconinck@esat.kuleuven.be 11

lecta **Research questions (cont.)**
KU LEUVEN

- dynamic aspects
 - different time scales
 - power electronics: sub-cycle
 - contingency: cycles .. seconds
 - economic optimisation: minutes .. hours
- dependability aspects
 - fault and failure models?
 - reliable communication
 - on top of unreliable infrastructure
 - different quality-of-service requirements

© K.U.Leuven - ESAT/ELECTA Geert.Deconinck@esat.kuleuven.be 12

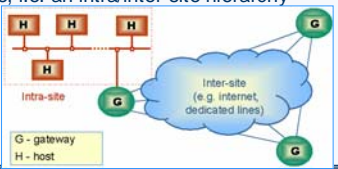

lecta **Overview**
KU LEUVEN

- introduction
- ➔ separating functionality & fault tolerance
- overlay network
- application example
- conclusion

© K.U.Leuven - ESAT/ELECTA Geert.Deconinck@esat.kuleuven.be 13

lecta **Summarizing dependability requirements of info'structure**
KU LEUVEN

- generic design
 - take advantage of same architecture
 - modular, composable
- fault tolerance
 - reconfiguration, self-testing & recovery abilities
 - separation of fault management from application
 - scalable fault management
 - using a hierarchical structure, i.e. an intra/inter-site hierarchy

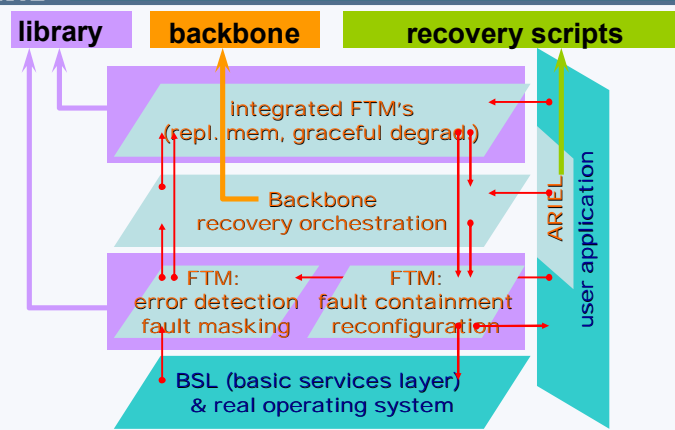

© K.U.Leuven - ESAT/ELECTA Geert.Deconinck@esat.kuleuven.be 14

lecta **TIRAN/DepAuDE framework approach**
KU LEUVEN

- middleware (implemented in C)
 - basic services layer (BSL)
 - communication: group, local, remote, tunnelled, ...
 - task / node management: start, stop, inform, ...
 - library of FTM (fault tolerance mechanisms)
 - detection, monitoring, masking, recovery, ...
 - backbone (distributed application + database)
 - collects information (from appl, FTM, BSL)
 - orchestrates recovery (coordination of FTM)
- ARIEL language
 - for configuration of middleware
 - for expression of recovery scripts

© K.U.Leuven - ESAT/ELECTA Geert.Deconinck@esat.kuleuven.be 15

lecta **Middleware architecture**
KU LEUVEN

© K.U.Leuven - ESAT/ELECTA Geert.Deconinck@esat.kuleuven.be 16

lecta
KU LEUVEN

ARIEL as recovery language

- check if entity ...
 - faulty?, isolated?, stopped?, running?, ...
 - ERRN(e), ERRT(e), PHASE(e)
 - expressions: ==, !=, ||, &&, !, ...
- then actions ...
 - stop! isolate! start! reboot! enable! send! ...
- metacharacters
 - task@: tasks for which guard is true
 - IF [FAULTY group1] THEN STOP@1
 - task~: tasks for which guard is false

© K.U.Leuven - ESAT/ELECTA Geert.Deconinck@esat.kuleuven.be 17

lecta
KU LEUVEN

Modifying recovery strategies

3-and-a-spare system:

```

IF [ -FAULTY group1 ] THEN
  STOP task@1
  WARN task~1
  START task4
FI

```

graceful degradation:

```

IF [ -FAULTY group1 ] THEN
  STOP task@1
  WARN task~1
FI

```

© K.U.Leuven - ESAT/ELECTA Geert.Deconinck@esat.kuleuven.be 18

lecta
KU LEUVEN

ARIEL as configuration tool

- configuration of basic tools
 - error detection, fault masking, isolation, recovery
 - templates for voting, recovery blocks, watchdogs, ...
- e.g.: replication (3-modular redundancy)

```

REPLICATED task10 IS task101, task102, task103
MULTICAST IS ATOMIC
METHOD IS MODULAR REDUNDANCY
  VOTING ALGORITHM IS MAJORITY
  METRIC "int_cmp"
END METHOD
ON SUCCESS task20
ON ERROR task30
END REPLICATED

```

ARIEL

lecta
KU LEUVEN

Advantage: uncouple recovery from application

- modify FT strategy w/o changing application
 - 3-and-a-spare vs. degrading voting farm vs. ...
- complexity ↓, maintainability ↑
- allows local & distributed recovery strategies

functional complexity fault tolerance complexity

application DB recovery run-time

IEEE T-Reliability 51(2):158-165

© K.U.Leuven - ESAT/ELECTA Geert.Deconinck@esat.kuleuven.be 20

Assumptions

- fault and failure assumptions
 - single physical faults
 - fail-silent failures
 - fault containment region: task or node
 - depending on HW & RTOS
- synchronous system model
 - known & bounded
 - processing delay
 - communication delay
 - clock differences / clock drift
 - corresponds to instantiation on dedicated system
 - no dynamic task creation

© K.U.Leuven - ESAT/ELECTA Geert.Deconinck@esat.kuleuven.be 21

Assumption coverage

- assumption coverage < 1
 - depending on instantiation on specific HW/RTOS
- optional mechanisms increase coverage
 - crash failure semantics
 - group-based communication, atomic multicast, ...
 - e.g. perfect communication, at OSI level 5
 - i.e.
 - no lost messages, no duplicates, keeping message order
 - but
 - CRC + level 2 retransmission (Ethernet)
 - BSL: ACK-management

© K.U.Leuven - ESAT/ELECTA Geert.Deconinck@esat.kuleuven.be 22

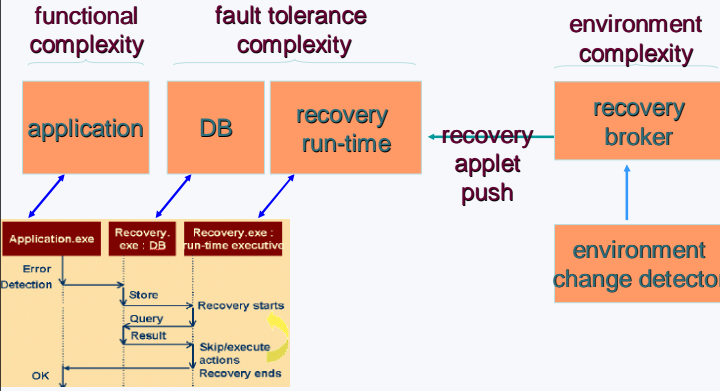

Framework implementation

- on embedded hardware / TCP/IP stack
 - RT network with SBC & PC
 - RTOS: QNX, WinCE, VxWorks, RMOS32
 - GPP OS: Linux, WinNT
- applications
 - DepAuDE applications
 - heterogeneous substation control system
 - airfield lighting automation system
 - info'structure for distr. PQ meas. & control
 - dynamic topology: remove/reintegrate nodes
 - robust communication: protocols & inforedund.

© K.U.Leuven - ESAT/ELECTA Geert.Deconinck@esat.kuleuven.be 23

Extension to dynamic environment

© K.U.Leuven - ESAT/ELECTA Geert.Deconinck@esat.kuleuven.be 24

Recovery sets & actions

- recovery sets
 - recovery actions
 - recovery set $RS_{i,j}$
 - recovery action $RA_{i,j,k}$
 - recovery action $RA_{i,j,l}$
 - recovery action $RA_{i,j,m}$
- based on resource / environment monitoring
 - selecting recovery actions
 - resource awareness
 - switching recovery sets/strategies
 - environment awareness
 - adaptation of QoS to environment conditions
 - graceful degradation

environmental conditions

error detection

available resources

loop 1: Switch to appropriate recovery set RS_i

loop 2: Execute appropriate recovery actions from RS_i

CI implementation

- parameters sampled
 - CPU usage
 - available memory
 - # reboots (up time)
- thresholds from literature
- OS-dependent
 - Win NT/2000/XP, QNX Neutrino RTOS, GNU/Linux
- example CI generation
 - $c=3$ counters, $t=2$ thresholds
 - CI=0 - normal state
 - CI>0 & CI ≤ 7 ($\leq 2^{c-1}$) - transient alert state
 - CI>7 ($> 2^{c-1}$) - transient alarm state
 - ADC - Alarm Duration Counter if $> \Delta T$ triggers
 - alarm state » alarm recovery set (switch of recovery set)

- conclusion

© K.U.Leuven - ESAT/ELECTA Geert.Deconinck@esat.kuleuven.be 29

lecta **Energy info's structure requirements**

KU LEUVEN

- energy applications: unbounded systems
 - <generator>
 - n <windturbine/>
 - s <ratedPowerKW>+10</ratedPowerKW>
 - <generationPercent>*</generationPercent>
- set </generator>
 - groups similar entities
 - XML description for entities
 - attribute based addressing
 - requires resource discovery
 - adapts over time

© K.U.Leuven - ESAT/ELECTA Geert.Deconinck@esat.kuleuven.be 30

lecta **Semantic Overlay Networks**

KU LEUVEN

- agora: a semantic overlay network
 - small-world overlay network
 - self-organising
 - **Small-world networks**
 - small diameter (best of random graphs)

locality	
Group locality	Time locality
nodes work in groups	nodes request same resource frequently
↓	↓
cluster by functionality	pre-link

© K.U.Leuven - ESAT/ELECTA Geert.Deconinck@esat.kuleuven.be 31

0.6

- semantic dis
 - metric refle

$$\delta(u,v) = 1 - \frac{\text{size}}{\dots}$$

© K.U.Leuven - ESAT/ELECTA Geert.Deconinck@esat.kuleuven.be 32

Links from Agora nodes

- companion links
 - to the semantically closest nodes
 - provide group locality support
- pupil links
 - to nodes semantically closest to expressions of interest
 - provide time locality support
- far links
 - link to the semantically furthest node
 - all nodes have 50% probability for far link
 - prevent network partitioning and reduces diameter
 - effectuate small world topology

© K.U.Leuven - ESAT/ELECTA Geert.Deconinck@esat.kuleuven.be 33

Node convergence

- nodes periodically converge
 - = send requests for better neighbours
 - handle dynamic environment
- requests are forwarded in the overlay
 - to the semantically closest area
 - several request strategies have been designed and evaluated

```

    graph TD
      Start(( )) --> Send[Send neighbour requests]
      Send --> Wait[Wait for and process answers]
      Wait -- convergence detected --> Sleep[Sleep]
      Sleep --> Send
      Wait -- no convergence detected --> Send
  
```

© K.U.Leuven - ESAT/ELECTA Geert.Deconinck@esat.kuleuven.be 34

To summarise

nodes periodically

- converge
 - companions
 - pupils
 - far links
- announce
 - optimise convergence
 - handle dynamism

Group locality

Time locality

Small world

Agora semantic networks provide a basic control- & data-infrastructure for unbounded systems

© K.U.Leuven - ESAT/ELECTA Geert.Deconinck@esat.kuleuven.be 35

Semantic routing

messages are forwarded to the neighbour semantically closest to the destination's description

= heuristic depth-first search with cycle-checking and without back-tracking

can be used to implement attribute-based RD supporting dynamic and mobile resource

Semantic distance used as heuristic

lecta **KU LEUVEN** **Fault tolerance: Embedded controllers require robust system architecture**

- to deal with
 - internal problems
 - physical faults in controllers or communication
 - external dynamic environment
 - changing interconnection topology
 - bandwidth reduction
- to exploit redundancy & diversity
 - in interconnections and resources
- for quantitative & qualitative assessment
 - explicit fault and failure model
 - dependability, time & cost constraints

© K.U.Leuven - ESAT/ELECTA

lecta **KU LEUVEN** **Design methodology for dependable embedded systems**

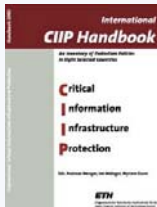

- explicit fault and failure models of ICT infrastructure
- dependability modeling
 - reliability, safety, ...
 - fault prevention, ~tolerance, ~removal, ~prediction
- instantiation of modular middleware architecture
 - dependable communication & computation
 - in dynamic environments
- assessment of dependability, time & cost constraints
 - conceptual evaluation and fault injection
 - interdependencies on other critical infrastructures
 - energy, telecom, information & fault propagation

© K.U.Leuven - ESAT/ELECTA Geert.Deconinck@esat.kuleuven.be

lecta **KU LEUVEN** **Outlook ICT: key for critical infrastructures**

- survivability of infrastructures
 - self-healing, autonomous system architecture
 - diversity for reduced vulnerability
 - middleware for heterogeneous, distributed systems
 - adaptive, reconfigurable in dynamic environment
 - interoperability
- assessment
 - infrastructure vulnerability / interdependency
 - fault propagation
 - performability evaluation of real applications
 - service point-of-view: end-to-end properties
 - focusing on interconnection of subsystems
